FOR IMMEDIATE RELEASE

CENTEX PRESENTS DESIGN PLANS FOR SHORT-TERM SLOPE STABILIZATION AND RECEIVES CITY PERMIT

San Antonio, Texas, March 16, 2010 — Centex met with City officials Monday to present the engineered design plans to perform the first phase of slope stabilization work at the Hills of Rivermist community.

As previously stated, the first step to implement the solution is slope stabilization work. This includes drilling and inserting a series of stabilizing piers in an engineered pattern across the slope failure area, specifically along the four home sites at the top of the hillside. These piers will stabilize the area so that soil and damaged portions of the wall can be removed. This step allows Centex to begin building a new wall.

Late Monday afternoon, Centex received City approval and obtained the necessary permit to begin work. Work is expected to start Wednesday, March 17, 2010 and to last up to thirty days.
